Targeting peptides identified by phage display, useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, inflammatory or autoimmune diseases, infections or cardiovascular disease.

Claim 22; Page 102; 317pp; English.

The invention relates to an isolated peptide of 100 amino acids or less in size useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, arthritis, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial infection, viral infection, cardiovascular disease or degenerative disease. The peptide is also useful for inducing apoptosis, particularly to a subject with ischaemia, cancer, arthritis, diabetes, cardiovascular disease,

```
The invention relates to an isolated peptide of 100 amino acids or less in size useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, arthritis, diabetes, inflammatory disease, atherosclerosis, autoimmume disease, bacterial infection, cardiovascular disease or degenerative disease. The peptide is also useful for inducing apoptosis, particularly to a subject with inflammation or macular degeneration. Furthermore, the peptide is useful for diagnosing the diseases cited above. Targeting peptides of the invention can also be used to deliver an agent to a foctus, by attaching subject. Sequences ABG60326-ABG60574 represent selective targeting

The present invention describes a method for treating obesity or a selective for adipose tissue; (a) obtaining a targeting peptide selective for adipose tissue; (b) attaching the peptide to a therapeutic agent to form a complex; (c) administering the complex to a subject; and dispose targeting peptides have anorectic and antilipaemic activities, and can be used in peptides have anorectic and antilipaemic activities, and can be used in peptide and gene therapy. The method is used for treating obesity or a lipodystropathy that is related to infection with human immundeficiency virus (HIV). The peptides used in the method can also be used for targeting delivery to an organ or tissue, such as placental delivery. A receptor that binds to a placenta targeting peptide is used to screen compounds for teratogenic activity. ABRS6806 to ABRS6827 and ACC79106 to ACC79111 represent sequences used in the exemplification of the present invention

Sequence 9 AA;

Targeting peptides identified by phage display, useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, inflammatory or autoimmune disease, infections or cardiovascular

                                                                                                                                                                                                                                                                                                                                                                      subject.
```

The present invention describes a method for treating obesity or a lipodystropathy, which comprises: (a) obtaining a targeting peptide selective for adipose tissue; (b) attaching the peptide to a therapeutic selective form a complex; (c) administering the complex to a subject; and (d) inducing weight loss in the subject or treating lipodystropathy. The adipose targeting peptides have anorectic and antilipaemic activities, and can be used in peptide and gene therapy. The method is used for treating obesity or a lipodystropathy that is related to infection with human immunodeficiency virus (HIV). The peptides used in the method can also be used for targeting delivery to an organ or tissue, such as also be used for targeting delivery to an organ or tissue, such as consecred addivery. A receptor that binds to a placenta targeting peptide is used to screen compounds for traracogenic activity. ABN558806 to ABN56927 and ACC79101 represent sequences used in the exemplification of the present invention

ö The invention relates to an isolated peptide of 100 amino acids or less in size useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, arthritis, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial infection, viral infection, cardiovascular disease or degenerative disease. The peptide is also useful for inducing apoptosis, particularly to a subject with inflammation or macular degeneration. Purthermore, the peptide is useful for diagnosing the disease cited above. Targeting peptides of the invention can also be used to deliver an agent to a foetus, by attaching apptide to the agent and administering the peptide to a pregnant subject. Sequences ABG60126-ABG60574 represent selective targeting Targeting peptide; cancer; arthritis; diabetes; inflammatory disease; atherosclerosis; autoimmune disease; bacterial infection; apoptosis; viral infection; cardiovascular disease; degenerative disease; ischaemia; inflammation; macular degeneration; antiinflammatory; antidiabetic; cardiovascular; immunomodulator; antibacterial; antiviral; cytostatic; Targeting peptides identified by phage display, useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, inflammatory or autoimmune diseases, infections or cardiovascular Targeting peptide; obesity; lipodystropathy; anorectic; antilipaemic; peptide therapy; gene therapy; infection; human immunodeficiency virus; HIV; placental delivery; teratogenic; placenta; adipose; pancreatic; beta-3 integrin; beta-5 integrin; spleen; aminopeptidase A. cancer-associated nucleic acid molecules (N) and proteins the cancer-associated nucleic acid molecules (N) and proteins are collectively known as colon cancer antigens. The colon cancer antigens have evestatic activity and can be used in gene therapy and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P car be used in the prevention, diagnosis and treatment of colorectal sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
                                                                                                                                    Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers.

The invention relates to a complex of protein-protein interactions between a Shigella flexneri polypeptide (e.g. ospB, ospD1, ipaD, ipaC, ipaH9.84, ospG and ospC1) and a mammalian polypeptide defined in the specification. The complexes are formed using the yeast two-hybrid system. Also included are (1) a recombinant host cell expressing the interactions between the Shigella flexneri polypeptide and a mammalian polypeptide and a mammalian polypeptide defined in the specification; (2) selecting a modulating compound obtained from the method of (2); (4) a SID computating compound obtained from the method of (2); (4) a SID comprising the human polypeptides appearing as ABG70042-ABG70242; (5) a SID polypeptides a vector comprising the vector; and (10) a protein chip comprising the vector; and (10) a protein chip comprising the composition of the composition of the composition of the composition of polypeptide or polymucleotide is useful for treating or preventing shigella shigelial structure of the polymucleotide is useful for treating or preventing and a mammalian polypeptide or mammalal. The present control of selection or mammalal. The present control of selection or mammalal. The present control or polymucleotide is useful for mammalal. The present control or protein control or mammalal. The processing the control or properties or protein control or mammalal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              represents a human prey protein isolated by the yeast two-hybrid
                                                                                                            flexneri polypeptide and a prey mammalian or human placenta polypeptide
for treating or preventing bacillary dysentery in a mammal or human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, nootropic, immunosuppressant, cytostatic, gene therapy; cancer, peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-brager Syndrome; chemotactic; chrombolytic; drug screening; arthritis; inflammation;
                                                                                            New complex of protein-protein interactions between a bait Shigella
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        assay, forming a complex of the invention with a shigella protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as alzeimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-brager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinihinha activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form

This synthetic peptide is a claimed example of a breast tumour-homing peptide that was identified using a novel method for obtaining molecules that home to a selected organ or tissue. This in vivo panning method trypically involves administering a phage display library to a subject, and identifying expressed peptides which home to the desired organ or tissue, e.g. brain, kidney, angiogenic vascular tissue or tumour tissue. The isolated peptides (see AAM1181-52, AAM1181-86) can be used to target e.g. drugs, toxins or labels to the selected organ/tissue (claimed) or to identify and/or isolate target molecules (claimed). The peptides can be directly identified in vivo, as compared to prior art in vitro screening methods, which require further examination to see if they
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tumour homing molecules and their conjugates - useful for, e g. directing linked moiety to tumour containing angiogenic vasculature.
                                         Obtaining compound that homes to selected organ or tissue - by in vivo panning method, specifically to identify brain, kidney, angiogenic vasculature or tumour tissue homing peptide(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumour homing peptide; in vivo panning; breast carcinoma; alpha-V-containing integrin binding motif; tumour.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM8642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

by in vivo panning. The peptide homes to a breat carcinoma. The in vivo panning comprises administering a library of diverse peptides to a subject having a tumour, collecting a sample of the tumour, identifying epetide that homes to the tumour, collecting a sample of normal tissue corresponding to the tumour, and determining that the peptide that homes to the tumour is not present in the normal tissue. The tumour homing

Such molecules are identified by treating a purified NGR receptor with a test compound and identifying compounds that bind specifically to the NGR receptor. The peptides of the invention are inhibitors of angiogenesis and can be used to produce conjugates for delivering agents to angiogenesis and can be used by produce conjugates for delivering agents to angiogenic vasculature, particularly anticancer drugs or an imaging agent, for diagnosis or prognosis. These conjugates may be directed to non-tumour angiogenic vasculature, e.g. that present in inflammatory, regenerating or wounded tissue, e.g. for treatment of macular degeneration, diabetic retinopathy or rheumatoid arthritis. The peptides provide specific targeting to rumours, especially their supporting vasculature, since the NGR receptor is exposed to the circulation only in angiogenic vasculature. Precise targeting should reduce the systemic toxicity of anticancer drugs in the conjugates. Complete killing of all target cells may not be essential since partial denudation of endothelium may result in an occlusive thrombus, and endothelial cells are unlikely to become resistant to anticancer agents nor to lose the targeting receptor. ```
The present invention describes composition of matter (I) comprising an Fe domain, pharmacologically active peptides, and linkers. Where (I) is: (XI)a-PI-(X2)b, where: FI = an Fe domain; XI and X2 = are each independently selected from -(L1)c-P1-(L2)d-P2-(L3)d-P2-(L1)c-P1-(L2)d-P2-(L3)e-P3. or -(L1)c-P1-(L2)d-P2-(L3)e-P3. or -(L1)c-P1-(L2)d-P2-(L3)e-P3. or -(L1)c-P1-(L2)d-P2-(L3)e-P3. or -(L1)c-P1-(L2)d-P2-(L3)e-P3. or -(L1)c-P1-(L2)d-P2-(L3)e-P3. or -(L1)c-P1-(L2)d-P2-(L3)e-P3. or -(L3)c-P1-(L2)d-P2-(L3)e-P3. or -(L3)c-P1-(L2)d-P2-(L3)e-P3. or -(L3)c-P1-(L2)d-P2-(L3)e-P3. or -(L3)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-F4 where P1, P2, P3-(L4)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-F4 where P1, P2, P3-(L4)c-P1-(L2)d-P3-(L4)f-F4 where P1, P2, P3-(L4)c-P1-(L2)d-P3-(L4)f-F4 where P1, P2, P3-(L4)c-P1-(L3)c-P3-(L4)c-P1-(L3)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L3)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L3)c-P3-(L4)c-P3-(L3)c-P3-(L4)c-P3-(L3)c-P3-(L4)c-P3-(L3)c-P3-(L3)c-P3-(L4)c-P3-(L3)c-P3-(L4)c-P3-(L3)c-P3-(L4)c-P3-(L3)c-P3-(L4)c-P3-(L3)c-P3-(L4)c-P3-(L3)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3-(L4)c-P3

Sequence 26031, Application US/0925291A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERBENCE: 136

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PRIOR PILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 26031

LENGTH: 596

Patent No. 6333404

GENERAL INFORMATION:
PAPELICANT: FULINGRAP, TSUTOMU
PAPELICANT: HORIE, MASATO

TITLE OF INVENTION: SKELETAL MUSCLE-SPECIFIC UBIQUITIN-CONJUGATING ENZYME
TITLE OF INVENTION: SKELETAL MUSCLE-SPECIFIC UBIQUITIN-CONJUGATING ENZYME
TITLE OF INVENTION: MUMBER: US/09/565,538

CURRENT APPLICATION NUMBER: US/09/565,538

CURRENT PILING DATE: 1999-03-22

PRIOR PILING DATE: 1999-03-22

PRIOR PILING DATE: 1998-04-07

PRIOR PILING DATE: 1997-03-19

PRIOR PILING DATE: 1997-03-05

                                           Sequence 37, Application US/09273565A

Sequence 37, Application US/09273565A

Patent No. 6166190

GENERAL INFORMATION:
APPLICANT: WATANABE, TAKESHI
APPLICANT: HORIE, MASATO

TITLE OF INVENTION: AN ISOLATED NUCLEIC ACID MOLECULE ENCODING HUMAN

TITLE OF INVENTION: AN ISOLATED NUCLEIC ACID MOLECULE ENCODING HUMAN

TITLE OF INVENTION: AN USOLATED NUCLEIC ACID MOLECULE ENCODING HUMAN

TITLE OF INVENTION: SKELFTAL MUSCLE-SPECIFIC UBIQUITIN-CONUUGATING ENZYME

FILE REFERENCE: Q-53599

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

23.5K protein - Marek's disease virus (type 1, strains Md5 and GA)
NyAlternate names: UL45h protein
Cispecies: Marek's disease virus
AiNote: host Gallus gallus (chicken)
Cibate: 30-Jun-1991 #sequence_revision 30-Jun-1991 #text_change 16-Jul-1999
Cipacession: B22818 / Q2207
Cipacession: B22818; Virus
Airle: Comparison of the sequence of the secretory glycoprotein A (GA) gene between Md5
Airle: Comparison of the sequence of the secretory glycoprotein A (GA) gene between Md5

Pasqualini R; Arap W,

WPI; 2002-415731/44.

Targeting peptides identified by phage display, useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, inflammatory or autoimmune diseases, infections or cardiovascular disease.

Claim 22; Page 108; 317pp; English.

The invention relates to an isolated peptide of 100 amino acids or less in size useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, arthritis, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial infection, viral infection, cardiovascular disease or degenerative disease. The peptide is also useful for inducing apoptosis, particularly to a subject with ischaemia, cancer, arthritis, diabetes, cardiovascular disease,

The method is used for treating obesity or a lipodystropathy that is related to infection with human immundeficiency virus (HIV). The peptides used in the method can also be used for targeting delivery to an organ or tissue, such as placental delivery. A receptor that binds to a placenta targeting peptide is used to screen compounds for teraregenic activity. ABRS6806 to ABRS6827 and ACC79106 to ACC79111 represent sequences used in the exemplification of the present invention
inflammation or macular degeneration. Furthermore, the peptide is useful for diagnosing the diseases cited above. Targeting peptides of the invention can also be used to deliver an agent to a foetus, by attaching a peptide to the agent and administering the peptide to a pregnant subject. Sequences ABGG0326-ABGG0574 represent selective targeting peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Targeting peptide; obesity; lipodystropathy; anorectic; antilipaemic; peptide therapy; gene therapy; infection; human immunodeficiency virus; HIV; placental delivery; teratogenic; placenta; adipose; pancreatic; beta-3 integrin; beta-5 integrin; spleen; aminopeptidase A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating obesity or a lipodystropathy comprises obtaining a targeting peptide selective for adipose tissue, attaching the peptide to a therapeutic agent to form a complex, and administering the complex to
                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                            ö
                                                                                                                                                                                   Length 31;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antichinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecule for diagnosing, preventing or treating diss
such as proliferative (e.g. cancer), inflammatory, immune, metabolic,
genetic, bacterial and viral diseases.

                                                                                                                        New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                                                                                                                                                                       The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antibidiammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                Gaps

The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecule for diagnosing, preventing or treating disesuch as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                               K, Beaurang PA, Behrens D

Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                 The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immunos, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, anticinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecule for diagnosing, preventing or treating disk such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.

                                                                                                                                                                                                                                                                                               diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                                                                                                                                                                                                                                                                                                                                              The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                           New nucleic acid molecule for diagnosing, preventing or treating disk
such as proliferative (e.g. cancer), inflammatory, immune, metabolic,
genetic, bacterial and viral diseases.

```
The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, anticharmatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; SEQ ID NO 2697; 428pp; English.

                                                                        New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic, Antiinflammatory, Immunosuppressive, Antibacterial, Virucide, cancer, inflammatory; immune, human secreted protein.
                                                                                                                                                                                                    The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antihilammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immunos metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                    New nucleic acid molecule for diagnosing, preventing or treating disesuch as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                                                                                                                                                                                                                   The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immunos, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.

# Claim 1; SEQ ID NO 2720; 428pp; English.

The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antifinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory,

ö immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification. Sequence 38435, Application US/09270767

GENERAL INFORMATION:

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster FILE REFERENCE: FILE Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270, 767

CURRENT FILING DATE: 1999-03-17

SOFTWARE: PatentIN Ver. 2.0

SEQ ID NO 38435

LENGTH: 79
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
